
Iran Has Secretly Built 4000 Centrifuges

(Tuesday, 09 August 2005) -

By : Alireza Jafarzadeh

Washington, DC

According to information that I have received from my sources inside Iran, who have been proven accurate in the past, Iranian regime has violated its agreement with the EU3, and has produced some 4,000 centrifuge machines ready to be installed in Natanz uranium enrichment site. Iran is rapidly building the concrete foundations, and is engaged in other building construction at the Natanz site. The engines for centrifuges are imported mainly from China, as well as other countries under the cover of industrial use ; other parts such as ball bearings, mechanical parts, and casings are produced in Isfahan. A number of front companies of the Atomic Energy Organization of Iran are located in a seven-story building in Tehran. The building is owned by the AEOI, and is located at Tehran, Seyyed Jamal Aldin Assadabadi Avenue, 15th street, number 33.

A number of front companies are located at this building.

Pars Trash Company occupies the first floor of the building, and is tasked with building centrifuge machines. The executive board of the company is as follows:

Morteza Behdad, President of the executive board
Mohammad Hossein Allahdad, vice president of the board
Mohammad Esmaili, director
Mohammad Ali Afshari, member of the executive board
Mohammad Afshari, member of the executive board
Abdollah Jodat, member of the executive board

Kalaye Electric Company which is involved in producing, testing, and assembling centrifuge machines occupies the second, third, and fourth floor of the building.

Energy Novin Company works on building centrifuge parts, and occupies the fifth and sixth floor.
Nuclear Electronic Company, a new front company, is located in the seventh floor.
